

Unpolluted Decisions: Air Quality and Judicial Outcomes in China

Trabalho de Econometria

Miguel Sallum e Felipe Bailez

FEA-USP

13/11/2020

Usaremos a base de dados do paper “Unpolluted Decisions”, de Hou e Wang(2020).

o paper se faz parte de um conjunto recente de papers sobre “fatores externos” afetando as decisões de juízes.

Tem como pares papers que indicam que juizes americanos são afetados pelo clima [Heyes and Saberian 2019], pela alimentação [Danziger, Levav and Avnaim-Pesso 2011] e até por resultados esportivos [Eren and Mocan 2018].

O paper trás dados sobre o sistema penal Chinês – em casos de narcóticos, que são de mais fácil comparação – e busca ver o efeito de poluição na decisão de juízes.

Como a legislação chinesa tem regras para quantidades diferentes que não permitiriam uma única linha de regressão adequada, decidimos restringir nossa amostra para somente os casos de menos de 10 gramas. Trabalharemos então com aproximadamente 8000 observações, abrindo mão de 2000.
